

MOT & Garage Booking Marketplace

Multi-Garage Platform — Mobile App & Web Application Documentation

1. Project Overview

The platform is designed for multiple garages to operate through one common system. Customers can discover garages, view the services offered by each garage, compare available options, choose a suitable garage and book a service.

Each garage operates its own business area inside the platform. A garage can manage its profile, services, prices, working hours, available slots, staff, customers, vehicles and bookings.

The platform works as a marketplace: multiple garages are available to customers, while each garage manages only its own business operations.

2. Technology Stack

Area	Technology	Use
Mobile App	React Native	Garage owner and staff operations.
Web Application	React.js	Platform administration and customer-facing web features.
Backend	Node.js + Express	Handles users, garages, services, bookings, vehicles, reminders and notifications.
Database	MongoDB	Stores platform and garage-related information.

3. User Roles

Role	Responsibilities
Platform Super Admin	Manages the complete platform, approves garages, manages platform settings, monitors overall activity and manages garage accounts.
Garage Owner / Admin	Manages one garage including its profile, services, prices, working hours, slots, bookings, customers, vehicles and staff.
Garage Staff	Handles day-to-day garage operations such as bookings, customer information, vehicle information and service updates.
Customer	Finds garages, views services, selects a garage, selects a service and slot, books appointments and manages vehicles.

4. Garage Onboarding Flow

A new garage can join the platform through the following process:

1. Garage owner selects Register / Join as Garage.
2. Garage owner enters garage details such as garage name, address, contact details and business information.
3. Garage owner adds the services provided by the garage.
4. Garage owner adds service prices and approximate service duration.
5. Garage owner sets working days, working hours and available booking slots.
6. Garage owner can add staff members who will work at the garage.

7. Garage submits the garage profile for approval.
8. Platform Admin reviews the garage information.
9. After approval, the garage becomes active on the platform.
10. Customers can now search for the garage and make bookings.

5. Garage Profile

Every garage has its own profile that customers can view.

- Garage name and logo/photo.
- Garage address and contact details.
- Opening and closing hours.
- Description of the garage.
- Services offered.
- Service prices.
- Available booking slots.

6. Garage Service Management

Garage can manage	Details
Add Service	Create a new service offered by the garage.
Service Name	For example: MOT, Full Service, Interim Service, Brake Service, Tyre Change, Diagnostics.
Price	Set the price customers will see for the service.
Duration	Set an approximate time required for the service.
Availability	Decide when the service can be booked.
Active / Inactive	Garage can temporarily hide a service without deleting it.

7. Garage Availability & Slot Management

Each garage controls its own available appointment slots. Customers only see slots that are available for the selected garage and service.

- Garage sets working days.
- Garage sets opening and closing time.
- Garage defines bookable appointment slots.
- Garage can block a slot when it is unavailable.
- Once a slot is booked, it should no longer be offered to another customer when the capacity is full.

8. Customer Journey

1. Customer opens the platform.
2. Customer searches or browses available garages.
3. Customer selects a garage.
4. Customer views the garage profile, services, prices and available slots.
5. Customer selects a service.
6. Customer selects or adds a vehicle.
7. Customer selects an available date and time.
8. Customer confirms the booking.
9. The booking is sent to the selected garage.
10. Garage accepts, rejects or reschedules the request.
11. Customer receives the updated booking status.
12. After the appointment, the garage marks the service as completed.

9. Customer Booking Flow

- Step 1 — Select Garage: Customer chooses the garage they want to visit.
- Step 2 — Select Service: Customer chooses a service listed by that garage.
- Step 3 — Select Vehicle: Customer selects an existing vehicle or adds a vehicle.
- Step 4 — Select Slot: Customer selects an available appointment date and time.
- Step 5 — Submit Booking: Customer confirms the booking.
- Step 6 — Garage Review: The selected garage receives the request.
- Step 7 — Confirmation: Garage accepts, rejects or reschedules the request.
- Step 8 — Customer Update: Customer receives the final booking status.

Important: A booking is always connected to the selected garage, service, customer, vehicle and appointment slot.

10. Garage Booking Management

- View new booking requests.
- View customer and vehicle details required for the booking.
- Accept a booking.
- Reject a booking when the garage cannot provide the service.
- Reschedule a booking to another available time.
- View upcoming bookings.
- View completed and past bookings.
- Update the booking status during the service process.

11. Booking Statuses

Status	Meaning
Requested	Customer has submitted a booking request.
Confirmed	Garage has accepted the booking.
Rescheduled	Garage has proposed or selected another time.
In Progress	Customer's vehicle/service work has started.
Completed	Service has been completed.
Rejected / Cancelled	Booking will not take place.

12. MOT Reminder System

The platform automatically checks MOT expiry dates for eligible vehicles connected to the platform. The purpose is to remind customers before their MOT expires and convert the reminder into a booking.

Daily 8:00 AM Scanner

Every day at 8:00 AM, an automatic system check runs in the background. It checks the database for vehicles whose MOT expiry date is approaching.

1. System checks the MOT expiry date.
2. System calculates the number of days remaining.
3. If the vehicle reaches the configured reminder point — 45, 30 or 7 days before expiry — a reminder is generated.
4. Reminder is sent to the customer through the configured communication method.
5. Customer opens the reminder and can choose to book an MOT.
6. Customer selects a suitable garage/slot according to the platform's available booking flow.
7. The selected garage receives the booking request.
8. Garage confirms or reschedules the appointment.

In simple terms, the 8:00 AM scanner is an automatic daily assistant that checks upcoming MOTs instead of requiring staff to manually check vehicles every morning.

13. Customer Vehicle Management

- Customer can view their vehicles.
- Customer can add a new vehicle.
- Vehicle details can be checked using the registration number where applicable.
- Customer can request that a vehicle be marked as sold or scrapped.
- Garage reviews and approves relevant vehicle changes.
- Inactive, sold or scrapped vehicles should not continue receiving normal MOT reminders.

14. Garage Staff Management

1. Garage owner/admin opens Staff Management.
2. Garage owner creates staff accounts.
3. Staff receives access to the garage's operational features.
4. Staff can manage bookings and other permitted activities.

15. Platform Super Admin

- View the overall platform dashboard.
- Review new garage registrations.
- Approve or reject garages.
- View all active and inactive garages.
- Manage garage accounts.
- View overall booking activity.
- Manage platform-level settings.
- Monitor platform users and activity.

16. Main Screens

User	Main Screens
Super Admin	Dashboard • Garage Requests • Garages • Garage Details • Users • Bookings • Reports • Settings
Garage Owner/Admin	Dashboard • Garage Profile • Services • Prices • Working Hours • Slots • Bookings • Customers • Vehicles • MOT Reminders • Staff • Settings
Garage Staff	Dashboard • Bookings • Customers • Vehicles • Alerts • Service Updates
Customer	Home • Garage Search • Garage Details • Services • Vehicle Selection • Slot Selection • Booking • My Bookings • My Vehicles

17. Multi-Garage Data Separation

Each garage is treated as a separate business within the same platform. This separation is important for privacy and correct operations.

- Garage A can manage only Garage A's services, staff, customers and bookings.
- Garage B can manage only Garage B's services, staff, customers and bookings.
- A customer can book different garages, but every booking clearly identifies the selected garage.
- Garage staff should not see another garage's private customer or booking information.
- Platform Admin can view platform-wide information according to administrative permissions.

18. Complete Example

Customer needs an MOT: The customer opens the platform and sees multiple garages. They select Garage A, view its MOT service and price, choose their vehicle and select an available 10:00 AM slot. The customer submits the booking. Garage A receives the request and confirms it. The customer receives the confirmation. Other garages do not receive or see this booking.

Garage joins the platform: A garage owner registers, provides garage details, adds MOT and other services, sets prices and working hours, adds staff and submits the garage for approval. After the Platform Admin approves it, customers can find and book that garage.

19. Overall Platform Flow

Garage Registration → Garage Approval → Garage Profile Setup → Add Services → Set Prices → Set Working Hours & Slots → Garage Goes Live → Customer Searches Garages → Select Garage → Select Service → Select Vehicle → Select Slot → Booking Request → Garage Confirms/Reschedules → Customer

Receives Update → Service Completed

MOT Reminder Flow: 8:00 AM Daily Check → Check MOT Expiry → 45/30/7-Day Reminder → Customer Opens Reminder → Customer Books MOT → Booking Goes to Selected Garage → Garage Confirms Booking

20. Key Business Rules

1. Only approved garages should be visible for normal customer bookings.
2. Each garage manages its own services, prices, availability and staff.
3. Customers select a garage before booking a garage-specific service.
4. A booking belongs to one selected garage.
5. Garage staff can access only the data and functions permitted for their garage.
6. The daily 8:00 AM scanner checks eligible vehicles across the platform.
7. MOT reminders are generated at the configured reminder points, including 45, 30 and 7 days before expiry.
8. Sold or scrapped vehicles should stop receiving future MOT reminders once the status is approved/updated.
9. A garage can activate or deactivate its services and manage its available slots.

Document Version: Multi-Garage MOT & Garage Booking Marketplace v1.1

Prepared: August 13, 2026

Additional Requirements from Application Testing

The following requirements were identified during application testing. Only points that were not already covered in the main document have been added here.

1. Garage Verification Documents

When a garage creates its profile, it should be able to upload verification documents. Examples include a government-approved MOT licence and address proof.

Annual Verification: Garage documents must be submitted again every year for verification. The system should store the verification date and send the garage a reminder before the renewal is due.

2. Garage Rating & Distance

When customers view available garages, the garage information should also show its rating and distance from the customer in miles. This helps customers choose a suitable garage.

3. Customer Cancellation & Rescheduling

Customers should be able to cancel and reschedule their appointments.

Cancellation Notice: A cancellation notice period will be decided by the business. The customer must cancel within the allowed period. The exact duration is to be finalized.

4. Vehicle Data Lookup

The platform should consider connecting the vehicle registration number with an appropriate vehicle-data source. When a customer searches using a registration number, the system should return the available vehicle details, similar to the information shown by vehicle-insurance or vehicle-check services.

To be finalized: The appropriate provider, available vehicle information, access requirements and cost need to be researched before this integration is implemented.

5. MOT Reminder & Booking Rule

The system can send MOT reminders before the expiry date, including the existing reminder points. However, a customer should be able to book an MOT only when the vehicle is within 30 days of its MOT expiry date.

This means a reminder may be received earlier, but the actual MOT booking option should remain unavailable until the vehicle reaches the 30-day booking window.

6. MOT History & Pass/Fail Status

The platform should consider connecting with the relevant UK government MOT data service so that customers can view available MOT history and the vehicle's MOT status, including pass/fail information where provided.

To be finalized: The available government data service, access method, permitted data fields and integration requirements need to be researched before implementation.

7. Vehicle Ownership & Management

The customer should be responsible for managing their own vehicle records. Garage staff should not directly manage or edit customer vehicle ownership records.

8. Garage Admin Roles & Permissions

Garage Owner/Admin and Garage Staff should have clearly separated permissions. The Garage Owner/Admin manages the garage, while staff receive only the access needed for day-to-day operations.

Area	Garage Owner / Admin	Garage Staff
Garage Profile	View & manage	View only / as permitted
Services & Prices	Add, edit, activate/deactivate	View / use for bookings
Bookings	Full management	Day-to-day management
Staff	Create, manage and remove	No access
Garage Documents	Upload & manage	No access
Reports	View garage reports	View if permitted

9. Garage Closure & Address Change Notifications

If a garage closes or changes its address, customers associated with that specific garage should receive an update. The notification should clearly explain the change and any action required from the customer.

If there are future bookings affected by the closure or address change, those bookings should also be reviewed and the customer should be informed.

10. MOT & Repair Reports

The platform should provide reports covering MOT and repair/service activity across garages.

- All garage MOT bookings/services.
- All garage repair/service bookings.
- Completed, cancelled and rescheduled bookings.
- Garage-wise reports.
- Date filters such as today, this week, this month and custom date range.

11. Terms, Conditions & Blacklisting

Terms and conditions should be available for both garages and customers. Garage owners should accept the applicable garage terms during onboarding, and customers should accept the applicable customer terms where required.

The platform should also support blacklisting of garages or customers when required. A blacklisted account should be restricted according to the rules and reason defined by the Platform Admin.

12. Points Already Covered in the Main Document

The following testing observations were already covered, so they have not been duplicated as new requirements:

- Multiple vehicles: Customer vehicle management already covers viewing and adding vehicles.
- Rescheduling: The existing booking flow already includes garage/customer appointment rescheduling.
- 8:00 AM MOT scanner: Already documented.
- 45/30/7-day reminder points: Already documented; the new 30-day booking restriction has been added above.
- Garage roles: Basic roles already existed; the more detailed Garage Owner/Admin vs Staff permissions have been added above.

- Garage reports: General reporting existed; the new MOT/repair reports with date filters have been added above.
